

Search Modes: Contains and RegEx Match (Simsapa v0.5.1)

<https://simsapa.github.io/>

Outline

- 1 Contains Match
- 2 Limitations
- 3 RegEx Match
- 4 AND Expressions

Contains Match

If any part of the text contains the query exactly, it matches.

bodhi will match the 'bodhi' part in **bodhisatta**.

dukkha will match the 'dukkha' part in **dukkhassa**,
but will not match **dukkho**.

dukkh will match **dukkho**, since it contains 'dukkh'.

The query is executed as an SQL %query% expression.

Limitations

Stemming and accent folding happens only in **Fulltext Match**.

Contains Match and **RegEx Match** queries are used in the exact form given.

This means they don't stem Pāli words and don't fold accents.

bodhiya will not match **bodhi** or **bodhiyā**.

Search As You Type is disabled for these modes.

Press Enter or click the search button to run the query.

RegEx Match

If part of the text satisfies the query as a regular expression pattern, it matches.

To improve the time of RegEx queries, select a **Language** and **Source** filter, so that not all database records are scanned for matches.

AND Expressions

The search query is split on **AND** (must be uppercase).
This combines each expression as a filter.

Examples:

dukkha AND sukha “Contains Match” means a text has to match:

- **%dukkha%** first, and then also
- **%sukha%**

dukkha AND sukh\w+ “RegEx Match” means a text has to match:

- **dukkha** first, and then also
- **sukh\w+**
